"Flan-end-Document": Before coding, project manager makes plan; Write detailed documentation all phases of plan; Progress measured against the plan; Changes to project must be reflected in documentation and possibly to plan.

	Waterfall	Spiral	Agile
Description	1. Requirements analysis & specification 2. Architectural design 3. Implementation & Integration 4. Verification 5. Operation & Maintenance Depends on project manager	Combine Plan-and-Document with prototypes; Pather than plan & document all requirements let, develop plan & requirement documents across each iteration of prototype as needed and evolve with the project	Constant heretim; Agile emphasizes Test-Driven Deve lopment (TDD) to reduce mistakes, varieten down User Stories to validate customer requirements, Velocity (avg #of points/week) to measure progress
Benefits	Good for bigger teams	hwolve prototypes & validation	Quarter deretions

## HTTP:

- HTTP request includes request method (GET, POST, etc.), Uniform Resource Identifier (URI), HTTP protocol version understood by the client, headers—extra inforegarding transfer request
- Since HTTP is stateless, you use cookies in order to store data to help guide them through the pages of the app (e.g. authentication, flow/c lick tracking, customination, etc.)

## 3-Tier Shared Architecture:

Shared Nothing Architecture

## MVC:

- Controller moderates between model and view
- Any instance variable declared in the controller is made available in the view
- Inheriting from ActiveRecord gives each model the ability to perform CRUD.
- Any instance variable declared in the model that is not part of the database will need to refreshed to initialize differ every request made to the sup.
- In MVC, each interaction the user can do is handled by a controller action.
- Ploutes: routes maps <HTTP verb UE1>→controller action.

## Puby

- First lection lets us ask an object que stions about itse if and have it modify itself
- Metsprogramming lets us define new code at runtime
- Modules = Collection of methods that even't a class
- A closure is the set of all variable bindings you can "see" at a given point in time it "t loses over" all the variables you can see, its hading nonlocal variables
- Phiby blocks are closures: they carry their environment around with them.
  - Result: blocks can be in reuse by separating what to do from where & when to do it.
- Duck typing encourages behavior reuse: "inito-in" a module and rely on "everything is a method call—do you're spond to this method?"
